                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   seq_name:
                                   The present cDNA sequence encodes human B7-4 membrane (B7-4M) protein having a transmembrane and short cytoplasmic domain. The human B7-4 cDNA is isolated from human activated keratinocyte and placental cDNA libraries. B7-4 gene is localised on human chromosome 9 The invention relates to a method for modulating immune: sponse by contacting an immune cell with an agent that modulates smalling via B7-4 or its receptor Bp-1. Modulating the interaction bot ween Pp-1 and B7-4 modulates a costimulatory or an inhibitory signal in the modulating an immune response. The invention is useful for upregulating an immune response to treat tumours, neurological diseases and immunospressive diseases or to downregulate an immune response response incention in the meant transcribers.
                                                                                                                                                                                                                                            Treating e.g. cancer or allergies comprises contacting an immune cell with an agent that modulates signaling via PD-1 or E7 (10 modulate timmune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          graft-versus-host disease; immunosuppressive disease; organ transplant;

useful in organ transplants, graft-versus-host disease (GVHD), allergies and viral infections e.g., acquired immune deficiency (AIDS). The invention also provides B7-4 or PD-1 fusion protein

which are useful for treating immunological disorders, such as autoimmune diseases e.g., heart disease, myocardial infarction and atherosclerosis or in the case of inhibiting rejection of transplants. These fusion proteins are also used as immunogens to produce anti-B7-4 antibodies. Pb-1 is useful in promoting the maintenance of pregnancy. B7-4 protein is highly expressed in placental trophoblasts and plays a role in preventing maternal rejection of the foetus. B7-4 cDNA is also useful for

Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted B7-H6 protein-encoding cDNA of the invention.
                                                                                      112
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AADOSO53-AADOS106 represent cDNAs corresponding to 15 human secreted protein genes, and AAEO1164-AAEO1217 represent the proteins they encode. AAEO1218-AAEO1226 represent human secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (HUMA-) HUMAN GENOME SCI INC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-2000;

The sequence for mouse B7-H1 (mB7-H1) is also given (AAUGS560). B7-H1 is useful for co-stimulating T-cells such as helper T-cells that provide helper co-stimulating T-cells such as helper T-cells that provide helper cactivity for B-cell antibody-producing response e.g. IgG2a antibody response, in a mammal having an immunodeficiency disease, inflammatory condition or an autoimmune disease, by culturing B7-H1 receils caid encoding B7-H1 to the T-cells, such that the level of CD40 ligand on the recembinant cell e.g. an antigen presenting cell (APC) which is the progeny of a cell obtained from the mammal and has been transfected or transformed ex vivo with a nucleic acid encoding B7-H1, and administering the cell to the mammal prior to administration, the APC is pulsed with an antigen or an antigenic peptide. B7-H1 can be used to control pathologic cell mediated conditions (e.g. those induced by infectious agents such as Mycobacterium tuberculosis) or other pathologic cell mediated responses such as those induced by repended arthritis).

The nucleic acid and polypeptide sequences are useful for the diagnosis, prognosis and treatment of immunological disorders (e.g. arthritis, graft rejection and acquired immunological eyndrome), inflammatory disorders (e.g. psoriasis and asthma), renal disorders, embryonic disorders, brain-related disorders (e.g. cerebral oedema), cerebrovascular diseases (e.g. ischaemia), tumours, prostate-related disorders, pituitary-related disorders (e.g. Cushing's disease) and neurodegenerative diseases (e.g. Parkinson's disease).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunological disorder; arthritis; graft rejection; renal disorder; acquired immunodeficiency syndrome; inflammatory disorders; psoriasis; AIDS; embryonic disorder; brain; cerebral oedema; ischaemia; tumour; prostate; cerebrovascular disease; pitultary; Cushing's disease; neurodegenerative disease; Parkinson's disease; ss.

                                                                                                                          The invention relates to a method for modulating immune response by contacting an immune cell with an agent that modulates signalling via CC B7-4 or its receptor PD-1. Modulating the interaction between PD-1 and CC B7-4 modulates a costimulatory or an inhibitory signal in an immune cell. CC resulting in the modulation of the immune response. The invention is CC useful for upregulating an immune response to treat tumours, neurological CC diseases and immunosuppressive diseases or to downregulate an immune CC response useful in organ transplants, graft-versus-host disease (GVHD). CC treating allergies and viral infections e.g., acquired immune deficiency CC syndrome (AIDS). The invention also provides B7-4 or PD-1 fusion proteins CC which are useful for treating immunological disorders, such as autoimmune CC diseases e.g., heart disease, myocardial infarction and atherosclerosis CC or in the case of inhibiting rejection of transplants. These fusion proteins are also used as immunogens to produce anti-B7-4 antibodies. CC pD-1 is useful in promoting the maintenance of pregnancy. B7-4 protein is CC maternal rejection of the foetus. B7-4 cDNA is also useful for
                                                                                                                                                                                                                                                                                                                                                                                                               The present cDNA sequence encodes human B7-4 secreted (B7-4S) having a short hydrophilic tail without a membrane anchor or a transmembrane domain. The human B7-4 cDNA is isolated from human ctivated keratinocyte and placental cDNA libraries. B7-4 gene localised on human chromosome 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (DAND )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; B7-4 secreted protein; B7-4S; receptor PD-1; chromosome 9; tumour; antiviral; antiallergic; gene mapping; cytostatic; myocardial infarction; atherosclerosis; neurological disease; immunomodulatory; allergy; GVHD; graft-versus-host disease; immunosuppressive disease; organ transplant; acquired immune deficiency syndrome; AIDS; autoimmune disease; therapy;

CC The invention relates to human B7-4 secreted (B7-4S) protein, B7-4

Membrane (B7-4M) protein and their corresponding cDNA molecules. Human B7-4 proteins are useful for upregulating immune response to treat viral skin diseases such as Herpes disease or shingles disease, systemic viral diseases such as influenza, common cold and encephalitis, and for inducing tumour immunity or to downregulate an immune response useful in cryan transplants, graft-versus-host disease (GVHD), treating allergies and viral infections e.g., acquired immune deficiency syndrome (AIDS).

CC B7-4 antagonists are used to modulate the T cell co-stimulation by contacting an activated T cell with a B7-4 antigen. The invention is also used for producing non-human transgenic animals. It also provides B7-4 fusion proteins which are useful for treating immunological disorders, such as autoLimmune diseases or in the case of transplantation. B7-4 fusion proteins are used as immunogens to produce anti-B7-4 antibodies. B7-4 cDNA is also useful for gene mapping. Methods are provided CC for modulating the immune response of individuals, by inhibiting or enhancing the lymphokine synthesis by the activated T cells. Diagnostic, pharmacogenetics, screening and therapeutic methods are also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present cDNA sequence encodes human B7-4 secreted (B7-4S) protein having a short hydrophilic tail without a membrane anchor or a transmembrane domain. Human B7-4 protein is isolated from human activated keratinocyte and placental cDNA libraries. B7-4 gene is localised on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human B7-4 polypeptides useful for enhancing the immune response against a viral infection or induce a tumor immunity and to diagnose conditions related to aberrant B7-4 expression or activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CDS

                                                                                                                                                                                                       Percent Similarity:
                                                                                                                                                                                                                                                                                                                                         complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    27-AUG-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of an oligonucleotide comprising a sequence complementary to the Complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence, where the CC oligonucleotide which comprises a 1'-end sequence, where the CC oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence 3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC the full-length cDNAs. The primers are also useful for the CC the full-length cDNAs. The primers allow obtaining of the full-length CDNAs assally without any specialised methods. AAH03166 to AAH13628 and CC AAH3633 to AAH18742 represent human cDNA sequences; AAB92446 to AAH3633 represent human amino acid sequences; and AAH13629 to AAH13632 crepresent oligonucleotides, all of which are used in the exemplification CC of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Quality:

Specific uses are described for each of the 15 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoletic disorders, diseases of the immune system,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAD05053-AAD05106 represent cDNAs corresponding to 15 human secreted protein genes, and AAE01164-AAE01217 represent the proteins they encode. AAE01218-AAE01226 represent human secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the

The sequence for CC human B7-H1 (hB7-H1) is also given (AAU03559). B7-H1 is useful for CC co-stimulating T-cells such as helper T-cells that provide helper CC co-stimulating T-cells such as helper T-cells that provide helper CC condition or an amammal having an immunodeficiency disease, inflammatory CC condition or an autoinmune disease, by culturing B7-H1 with the CC mammalian T-cells in vitro, or administering B7-H1 or a nucleic acid cencoding B7-H1 to the T-cells, such that the level of CD40 ligand on the CC recombinant cell e.g. an antigen presenting cell (APC) which is the CC progeny of a cell obtained from the mammal and has been transfected or CC transformed ex vivo with a nucleic acid encoding B7-H1, and administering the cell to the mammal. Prior to CC administration, the APC is pulsed with an antigen or an antigenic CC conditions (e.g. those induced by infectious agents such as Mycobacterium CC tuberculosis) or other pathologic cell mediated responses such as those involved in autoimmune diseases (e.g. rheumatoid arthritis).
